. . As any other traditional engineering and manufacturing software, Autodesk applications are usually used for designing, modeling, and drafting of manufactured products. The difference is that we have also extended the concept to 3D printing. Autodesk Digital Manufacturing Solutions can be used for 3D printing in two main ways. - Selecting and applying 3D printing technology that fits the most appropriate model for your needs. - Repurposing the data generated with the model. In this case, you don't need to worry about selecting the right 3D printing technology. You're going to download the data to a computer that has already been designed for 3D printing. In the last few years, we have experienced a wave of innovation and industrial revolution in 3D printing thanks to the creation of new materials and techniques. At the same time, we have witnessed a progressive increase in the number of applications that are being considered for 3D printing, both in the public and private sector. Today, we're already using 3D printing to produce patient models, prosthetics, jewelry, sculptures, and even human organs, among many other applications. As an industry pioneer, Autodesk has been helping companies benefit from 3D printing since 2013. However, the real leap in the use of 3D printing in industrial settings began in 2017 with the release of Autodesk Forge. This major product upgrade allowed us to generate a 3D printable model in minutes and to apply 3D printing technology to most of the cases where we previously required complicated set-up, intricate manual operations, and sometimes, a specific machinery. However, the early adoption of 3D printing led to new challenges and unforeseen situations. The creation of 3D models means that we are now producing objects that are not used for the end-use application for which they were designed. In this case, we have to decide what to do with them. We can either repurpose them, recycle them, or dispose them as waste. We will see what options we have to manage these different types of 3D prints in this article. Repurposing {#sec:repurposing} ===== In the case of repurposing, we are able to reuse the 3D prints, taking advantage of the "by-products" that they generate. An example of this type of product is the printing of "X-rays 82157476af
